Brainstorm & Idea Prioritization Template:

The **Metro Ticket Generation System** is a ServiceNow-based application designed to automate the process of booking and managing metro tickets. The system allows users to request a metro ticket by entering journey details such as source, destination, travel date, and payment method. After successful submission, the system generates a unique metro ticket with a **QR code** for verification.

The primary objective of this project is to eliminate manual ticket booking, reduce waiting time, and provide passengers with a fast and secure digital ticketing experience. The QR code generated with each ticket can be scanned by metro authorities to validate the ticket quickly.

This solution improves operational efficiency, enhances user experience, minimizes paperwork, and ensures secure ticket validation. The project demonstrates how ServiceNow Catalog Items, Client Scripts, UI Pages, Business Rules, and Service Portal can be integrated to build a real-world ticketing application
