

Project Planning Phase

Project Planning Template (Product Backlog, Sprint Planning, Stories, Story points)

Date	26 June 2026
Team ID	
Project Name	
Maximum Marks	5 Marks

Project Planning

The planning phase sets the road map for development. It involves defining what the system will achieve and how the work will be organized. A standard software project plan includes:

Scope Definition: Clarifying what the system will do (e.g., QR booking) and what it won't do.

Requirements Gathering: Translating user needs into functional and non-functional specifications.

Timeline & Milestones: Establishing a schedule for development, testing, and deployment.

Resource Management: Identifying the tools (Service Now, Integration Hub) and expertise needed.

Risk Assessment: Identifying potential technical blockers (e.g., payment gateway APIs) and mitigation plans.

Project Logic

The project logic describes the "brain" of the system—the sequence of operations that occurs when a user interacts with the application. This is typically mapped out as a flow:

Trigger: The user selects a service (e.g., "Book Metro Ticket").

Validation: The system checks user input (e.g., Are the fields valid? Is there enough credit?).

Processing: The application triggers back-end scripts or flows to perform actions (e.g., calculating fare, calling an API).

Output: The system provides feedback, such as displaying the generated QR code or sending an email notification.
